Data Lab 6: Experimental/Quasi-Experimental Study Results

In this lab, you'll analyze the results of testing your intervention and write the results. Add your new data to SPSS and use an appropriate technique to see if it worked.

First, briefly describe the intervention. You can adapt some of the text from your previous lab but be sure to correct anything that changed during implementation.

In the next section, explain the results of your study. Did the intervention work? How much of an impact did it have? Is the impact statistically significant? Include any tables and graphs that help tell the story. If you don't think all/some of them help, put them in an appendix at the end.

In the final section, reflect on your results. How sure are you that the intervention did/didn't *cause* any impact? Discuss any threats to validity. Are there any other limitations to the study? If you could repeat your study on yourself, would you do anything differently? What if you were going to do it on a group of strangers? Add any other final thoughts here as well.
