In order to manage a client care, there is need for excellent leadership skills and knowledge to give the client the necessary care. Client management also requires the nurse to portray critical thinking, clinical judgment, conflict resolution, performance appraisal, delegating, supervising and cost effective care among other skills in managing the client's Health condition.

Underlying Principles

1. Prioritize on the clients actual problems before the future problems
2. Listen carefully to clients and don't assume
3. Prioritize systemic before local (Life before limp)
4. Recognize and respond to trends vs transient findings. it is important to recognize the client's level of consciousness
5. Apply clinical knowledge and the necessary procedural standards that determine the priority action
6. Recognize the indications of medical emergencies and complications vs. expected findings

Nursing Interventions

WHO? WHEN? WHY? HOW?

The following are the priority interventions steps in nursing.

1. Airway
It is necessary to identify the concern
2. Breathing
Effective breathing is important. This can also be done by administering naloxone or reposition
3. Circulation
The air circulation concern e.g. hypotension, compartment syndrome should be identified
4. Disability
The evolving disability e.g. Stroke once identified, action cab be implemented to slow down the development of the disability.
5. Exposure
It is important to ensure that the client is exposed e.g. by removing clothing in order to conduct a complete assessment.
