Argumentative Essay

Why is active learning more effective than passive learning?

Active learning refers to an approach to instruction that involves actively engaging students with course materials to improve their learning. Students are experientially involved in the learning process to help improve their school outcomes. Students are provided with the chance to be directed on what they should learn. Active learning is effective in realizing engagement in school work (Khan Et al. 2017). The teacher within the classes must have the ability to improve their expectations on the kind of activities that students perform. The students will be encouraged to perform activities their teachers seem to authorize and support. An improved expectation from teachers will help encourage students to participate in performing the class activities properly. Definite methodologies determine the expectation amongst the students to be promoted while studying in a class. Contrarily, passive learning is a method of learning where students receive instructions from the instructor and internalize it. Students do not receive feedback from their instructors.

Active learning activates higher order of thinking amongst students. The interaction of students and teachers provides the opportunity for interactions of what needs to be learned. Interactions make students think widely on various scopes of life to increase their understanding. Active learning can achieve a high order of thinking to enable the learner to grasp many concepts. Passive learning does not allow students to think because they retain what is learned. Students do not engage with their instructors because there are no questions that would get asked. 

Active learning improves the relationship between teachers and students. The relationship between students and teachers within the school. Proper participation can use a good relationship 

between the teachers and students to be improved (Javed & Odhabi, 2018). A strong working relationship within a classroom helps ensure that students are made free to contact their teachers on any form of activities that they may need to perform. Active student participation always ensures that planning within a classroom to be at a higher level that promotes the development of strategies.

Moreover, strategies that are developed amongst the students to help in class preparedness can be promoted. Class preparedness help in understanding the different concepts that active learning develops. The relationship between students and teachers needs to be strong to increase the efficiency of better systems that allow for understanding. The participation of students within the school is significant to improve their education systems. Active learning is influential in allowing students to carry out their school work activities. Students would learn Schoolwork effectively by applying active learning in institutions.

Active learning is more effective than passive learning because it ensures a robust relationship between teachers and students. Students can receive immediate feedback on classwork from teachers to help internalize the lessons. Active learning can improve the direction for learning amongst learners that provides room for consultations. Learners can make consultations with their teachers about the concepts they do not understand. Active learning develops an understanding of concepts that exist within the classroom.
