Article Analysis: Rand Report R-609 within Organization

According to the paper, “Rand Report R-609” was initiated by the Department of Defense and started a program that was meant to work towards attaining security that went past protecting physical locations. The program was to look for ways to define various controls as well as mechanisms necessary to ensure and enhance the protection of a multilevel computer system (Tagmouti, Boujmil Jamal and Raissouni 3). This paper seeks to expand the scope of computer security to include: limiting random, securing data, and unauthorized access to data. They sought to look for details about security issues that could be found within the computer systems. This was due to lack of security and there were threats that were posed by the outsiders. This is the point where hackers come into play.

In the past, people were just concerned with the physical security. However, as technological advancements in the field of Information, Communication and Technology were unveiled, people could reach out remotely to computer systems. This is what could be said to the biggest challenge within the ICT field. People are currently looking for ways through which they could address the issue of cyber security. This article is about how hackers hacking into the

computer systems. In order to find out what had happened, the computer experts have to carry out a forensic audit of the computer system.
