

PRADER, BRACKER, & ASSOCIATES

A Complete Health Care Facility

159 Healthcare Way • SOMEWHERE, FL 32811 • 407-555-6789

PATIENT: MYRICK, JULIE

ACCOUNT/EHR #: MYRIJU001

DATE: 10/16/18

Attending Physician: Oscar R. Prader, MD

S: Julie, a 47-year-old female, came to see me because her youngest son was getting married, leaving her alone. She stated that, over the last several weeks, she had begun having panic attacks whenever she thought about the upcoming separation. Patient has tried cognitive behavioral therapy and different medications without success.

O: CBC results showed the size of her red blood cells (MCV) was slightly abnormal. The range was 80–100, and she was 101. Evidence-based medicine has documented an elevated MCV could indicate a B₁₂ deficiency, so I had Julie do a Schilling test, which was positive.

A: Panic disorder without agoraphobia, vitamin B₁₂ deficiency.

P: Rx B₁₂ injections; patient to return in 10–14 days.

Determine the most accurate ICD-10-CM code(s).

WESTON HOSPITAL

629 Healthcare Way • SOMEWHERE, FL 32811 • 407-555-6541

PATIENT: ARNOLD, CAMERON

ACCOUNT/EHR #: ARNOCA001

DATE: 08/11/18

Attending Physician: Oscar R. Prader, MD

Cameron Arnold, a 39-year-old female, comes in to see Dr. Prader with complaints of weakness and several spontaneous nosebleeds that last approximately 10 minutes—10 days duration. She states that she bruises easily without any injury—3 times in the last month alone—and her menstrual periods have been notably heavier. Dr. White, the referring physician, asks that we rule out coagulopathy. PMH: non-contributory. PFH: no history of family bleeding.

Preliminary laboratory results reveal a hemoglobin of 6.7 g/dL. The mean corpuscular volume (MCV) is 71 fl. PT and APTT are within normal range.

A von Willebrand factor antigen assay, a von Willebrand factor activity assay, and factor VIII measurement were ordered; results confirm the diagnosis of von Willebrand disease.
