1. Hypothesis

A hypothesis is usually a statement that introduces a research question and the expected results. In this case, the expected hypothesis by the researcher or rather Dr. Banner would be, if you intervene to provide the necessary information to African Americans, especially males, more patients would go in for routine dialysis.

2. Type of Research

The research described is known as ethnography research. It is clear from the moment go that Dr. Banner will focus his research mainly on African Americans due to some behavioral characteristics dominant among members of this community. Ethnography research is a type of research whereby the researcher focuses on a particular culture, group, or community.

3. Data Collection

Several methods can be used especially when it comes to research that focuses on a somewhat broad population. In this case, Dr. Banner will likely go for interviews whereby he will interview his patients; he can also ask his patients to respond to questionnaires and form discussion groups.

4. Quantitative Data

Quantitative data is a form of data whereby collected data is assigned numerical values. Dr. Banner will likely record the number of patients coming in for dialysis after the intervention and compare it with previous data. If the number of patients relatively increases, then the intervention would have been successful.
