

Paper Title: Global Warming
No. of Pages: 3 Pages
Paper Style: APA Paper Type: Persuasive/Argumentative
Taken English? Yes English as Second Language? No
Feedback Areas: Transitions & Fluency, Organization
Paper Goals: Prepare a shortened version of your Final Paper: Introduction paragraph and thesis statement you developed for your Week 3 Assignment. Background information of the global societal issue you have chosen. Brief argument supporting at least two solutions to the global societal issue. Conclusion

Proofing Summary:

Hi Elliot,

I'm AJ, your composition tutor for the Writing Center. I have reviewed your submission and have several suggestions that will help you revise.

Below, you will find a revision plan along with margin comments within your paper. Use my suggestions as a starting point for the revision process. Also, please note that I have not edited or proofread the entire draft for minor errors, but rather, focused on overall concerns such as idea development. For a complete look at your grammar and punctuation, please use the Grammarly software available under "Writing Center" in your classroom.

This is a good start to your persuasive essay on global warming. I thought you did a good job with immediately stating the purpose of this assignment, and sticking to the overall theme of this purpose throughout the entirety of this paper. In addition to this, you also did well with using a strong amount of citations from scholarly resources to reinforce the points you were trying to make.

For your revisions, I suggest focusing on:

1. You have not yet addressed all of the items in the prompt. This prompt is a complicated one, to be sure. If you carefully break down the prompt, you will see that it is asking for you to:

discuss the problem,

propose a solution to the problem,

evaluate the validity, reliability, and biases of the sources you used in addition to pointing out where more research is needed, and show ethical implications of your proposed solution.

Please review this sample paper to help you to better understand the expectations of this assignment and to complete all of the necessary sections: <http://tinyurl.com/j7qq7mc>

When reviewing this sample paper, I would suggest paying extra attention to the level headings and the specific titles they used for these headings. Consider using these level headings as a template for how you should organize them.

2. The introduction paragraph should end with a thesis statement that includes the societal problem, your proposed solution to the societal problem and also the positive/negative ethical outcome of the solution. Consider following this format for your thesis: (Your issue) should/should not _____. Instead, we should (insert your solutions to the problem). These solutions create (insert the positive and negative ethical implications).

3. Develop your paragraphs more. In general, all paragraphs need to have 3 pieces:

P-Point—also known as your topic sentence where you state what the paragraph is about

I-Information—where you present your information (facts, details, quotes, and reasons).

E-Explanation—where you explain the relevance or importance of your information. Although you did well with making sure you addressed all of the topics required from you. There seemed to be a few parts to this assignment with underdeveloped ideas. Make sure you are fully answering all the questions asked from you in a complete manner.

Please be sure to do all of this when writing your paragraphs. For help with this, click here:

<http://writingcenter.bridgpointeducation.com/body-paragraphs>

Good luck in the course, and I hope we can help you with your next assignment.

Running head: GLOBAL WARMING

GLOBAL WARMING

2

Global Warming

Global warming is a current disaster that people have to deal with because of its adverse effects on lives. This is because global warming has various consequences like the extreme weather that is currently being experienced. It is the increase in earth's temperature caused by the changes in the weather patterns and climate of the globe. The common cause of this change is known to be caused when the carbon (IV) oxide, air pollutants, and greenhouse gases are released to the air. The pollutants consume the solar radiation and the sunlight; hence, the sunlight and the radiation are blocked causing the warming because of the trapped heat leading to the greenhouse effect. This has drastic effects that have to be dealt with because they bound the planet to doom. Therefore, climate change continues to be an issue and will make it difficult to grow crops, raise animals, catch fish and much more if the emissions are not reduced and stabilize the levels of heat-trapping greenhouse gases in the atmosphere. This paper examines global warming and solutions to curb the problem.

This is a good start to your thesis, but remember that for this assignment your thesis must state a problem, propose a logical solution, and include the positive/negative ethical outcomes of the solution.

Global warming is the changing in weather patterns and change in climate that increases the earth's temperature. This intensifies the changes in climate which have sparked debates about what causes the drastic changes. The planet has in many occasions experienced in the changes in the weather patterns beyond explanation. Several episodes of harsh weather have been felt in different parts of the planet. Global warming has drastic effects that have been felt and with the rising changes in the weather more effects are likely to be felt. Episodes like hot summer, drought in California, the twentieth-century El-Nino and La-Nina have been experienced (Mann Rahmstorf, Kornhuber, Steinman, Miller and Coumou 2017). And with what is known these episodes cause lives and settlement of people.

Keep in mind that this paper should be organized into sections via level headings. Consider reviewing the template for this assignment to ensure that you have addressed everything that was required from you for this paper.

GLOBAL WARMING

3

According to Mann et al (2017) hot summer, El-Nino, and other episodes like the 2003 European Heat Wave are persistent and costly. This means that there should be approaches or solutions to ensure that the effects are curbed. It is evident that global warming is changing the course to everything because it effects affects everything like people, animals, fisheries and other marine life. But the effect to the artic lower atmosphere is more rapid than any other part of the planet. According to Barnes and Screen (2015), the effect in the artic comes with the rapid melt of the sea ice. This, in turn, causes side effects to the fauna, flora and the valuable inhabitants of the artic (Barnes and Screen, 2015) Much is known of what has happened, however, what is to happen in the future is less known. According to Cai, Wang, Santoso, McPhaden, Wu, Timmermann, Collins, Vecchi, Lengaigne, Dommenges, Takahashi, Guilyardi and England (2015), it is unclear to demonstrate the change that El-Nino is likely to have in the future. Mann Rahmstorf, Kornhuber, Steinman, Miller and Coumou (2017) explain that the changes can be due to the rise in the temperature which in term raises the precipitation level through moist thermodynamics. However, the explanation is not enough because the changes are fast and adverse to the likely causes.

You do a great job of using plenty of citations from scholarly resources in this section of your paper, but you should consider supplementing these citations with more personal analysis in your own words.

Looking at the causes of global warming, human activities increase the likelihood of the climate changes. The activities release the gases to the atmosphere which in term interferes with the radiation and sunlight. Moreover, they weaken the summer cyclone which causes intensified summer weather. As Mann et al (2017) explain studies indicate that the Northern Hemisphere summer jet and other storm activities weakened since 1979. This is an indicator that more is at stake that requires intervention. The more the activities that affect the atmosphere continue the more the changes in weather patterns. Cai, Borlace, Lengaigne, Rench, Collins, Vecchi, Timmermann, Santoso, McPhaden, Wu, Wang, Guilyardi, Jin and England (2014) estimate that

You do a good job here summarizing your thoughts with your final sentence, but you might consider adding a part to this sentence that gives a general introduction to the topic of the next paragraph.

Make sure you are ending this sentence with the proper citation information.

For more help with in-text citations, use this guide: <http://writingcenter.bridgepointeducation.com/citing-within-your-paper>

GLOBAL WARMING

4

the effects of global warming are likely to double from what has been seen. According to Baer and Singer (2016), global warming has caused infectious diseases, asthmatic conditions and allergies. [For information on integrating quotes, please click on this source: http://writingcenter.bridgepointeducation.com/quoting-paraphrasing-summarizing](http://writingcenter.bridgepointeducation.com/quoting-paraphrasing-summarizing)

Try to refrain from ending your paragraphs with citations. You should always try to end your paragraphs in your own words by wrapping up your thoughts from the current paragraph, and introducing the topic of the next paragraph with a transition sentence.

As the studies have suggested on the future effects, it is important for the society to take a new way to help curb the problem. This is through coming up with the effective solutions that will help to cool the atmosphere. First, the human activities that cause drastic changes to the atmosphere should be controlled. These consist of using machines or fossil fuels. The fossil fuels are known to be dangerous to the environment in the processes of extraction and formation. When they have burnt the gases that are emitted into the air cause the greenhouse effect that interferes with the weather patterns leading to unexpected climatic change.

You bring up some good points in this paragraph here, but it seems that you only cover the surface of this topic here. Consider trying to delve into these points to an even further extent.

Some of the machines that are used and are harmful are like the chemical refrigerators. These machines should be managed properly to reduce the number of gases that they release to the atmosphere. According to Green America (2017), the huge volumes of Chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons (HCFCs) that are the elements in refrigeration still cause the problem with the ozone layer. The use of these machines should be highly controlled to enable the healing of the Ozone layer. With the pollution of the environment with the gases and the use of machines like refrigerators, the gases are automatically released and this caused more harm than good. Therefore, it is crucial that in the processes of extraction of oil, coal, other natural gases and emission of CFCs and HCFCs, the gases that are emitted into the air to be contained. This way, it will be easier for the ongoing climatic changes to be contained to avoid the more impacts that it is likely to cause. This is because, if the ongoing projects like extraction and formation of other harmful gases continue then, what will happen in the future is not yet

Make sure you are using the most clear and concise language possible to make your points in your formal essays.

GLOBAL WARMING

5

known. And for what is worth, refrigeration management and safe extraction processes will help in the process of eliminating the damages to the Ozone layer.

The second solution is that reduce the food wastage. Apart from the fuels that release gases into the atmosphere, the food waste is another problem to be tackled to reduce global warming. Quite a value of the food that is produced from the farm, factory or industries does not reach the destination. According to Green America (2017), a third of produced food end in wastage which in turn contributes to 4.4 gigatons of Carbon (IV) oxide each year. The amount of CO₂ released by the waste from food increases the level of effect in the atmosphere. As Green America (2017) explains the wastes produce methane gases when the organic matters get to the garbage bins. This is a disaster to the weather since it enhances the deterioration of the climate. As such, when the amount of food reaching the garbage is reduced it can be easy to mitigate the problem. According to Green America (2017), a reduction of food wastage by 2050 will save the climate about 70.53 emissions of CO₂, hence, reducing the pace at which the climate is transforming.

In conclusion, this paper has examined global warming and the likely impacts of the problem and the solution to help reduce the climate change. Global warming has adverse effects on the people, animals, and marine organism. However, the Arctic lower atmosphere is highly affected by the changes in climate. This is due to its unexpected sea ice melt at a higher rate. It is a real issue that needs proper mitigation approaches since the future changes are unprecedented. Moreover, it is likely that the change in the future will be double of the current experienced changes. The solutions that can help to reduce the climate change include reduction of food wastage and reducing pollution of the environment with the fossil fuel extraction gases.

Make sure that you include sections in this essay that cover the ethical implications of your proposed solution and an evaluation of your sources. Both of these sections are necessary to complete this assignment.

This is a good start to your conclusion, but keep in mind your conclusion should somewhat resemble your introduction paragraph. It should summarize all the thoughts brought up in this paper, restate your thesis, and leave the reader with one last memorable statement.

Keep in mind that since this paragraph is only a summary of the ideas that were previously brought up in your paper, there should not be any citations or new information presented in this paragraph.
