Spring 2019 (1 credit hour course)**

Instructions for Database Project

Create a Microsoft Access database with mock data including creating relationships between tables, creating a query, and creating a form that allows you to add, delete, or update a record.

1. The Database should contain the following tables: Patient, Physician, Clinic, etc.
2. Unique keys need to be included for each table like a medical record number for a patient to uniquely identify the record.
3. Create relationships also known as joins between tables as needed using any related key fields.
4. Write a simple Select query that uses the Where clause to select a subset of records.
5. Build a simple form to add, delete, or update a patient.

Tips

- Use the Relationship button on the Database Tools menu to create relationships between tables with related key fields.
- Use the Query Design button on the Create menu to create the query. Once the Design View screen loads, right click on the query tab and select the SQL View to type in your SQL Query
 - o Sample Select Query (do not use this query):
Select ClinicName, TIN
From Clinic
Where TIN = '123456789'
- Use the Form Wizard on the Create menu to create the form.
 - o Select the Design view and add Text boxes and Buttons to the form for adding, deleting, or updating patient information.

Microsoft also has a good support site at <https://support.office.com/en-us/access>.

Upload to Blackboard or e-mail Microsoft Access file along with a short description of the database.

Evaluation Criteria

Evaluation for grade

1. Correct use of database tables
2. Correct use of unique key/foreign key
3. Successful join created between alike fields in at least two tables
4. Successful query written to select a subset of records from the table(s) of your choice
5. Successful form built to add, update, or delete a patient
