Reviewing Seizures

Forming a Testable Theory

Conclusion

Introduction

Health care remains to be one of the field much influenced by both the understanding and studying science that is the human body. Knowing what is happening and what is expected helps medical practitioners to respond in the best possible manner and help the patients with their recovery process. Considering the nurses cases for example, it remains essential to get an understanding of how theories on varying ailments are created and what needs to be effectively done to better them or

create other theories. Getting to understand several factors, which influence all these will assist in driving good diagnosis from the incomplete information from the patient..

Health care remains to be one of the field much influenced by both the understanding and studying science that is the human body. Knowing what is happening and what is expected helps medical practitioners to respond in the best possible manner and help the patients with their recovery process. Considering the nurses cases for example, it remains essential to get an understanding of how theories on varying ailments are created and what needs to be effectively done to better them or create other theories. Getting to understand several factors, which influence all these will assist in driving good diagnosis from the incomplete information from the patient. (2) Thus, People are capable to doing more work extremely well in handling and helping patients recover fully by the help of theoretical foundations of nursing. 3

Definitions

A phenomena in is all that which we witness and feel using our senses. We consider a phenomenon when the patient falls down, when the dog barks among others.

(3) Phenomena can be considered a fact that can be seen or experienced but one that the explanation for its existence is not very clear (McKenna et.al 2008

Definitions

A phenomena in is all that which we witness and feel using our senses. We consider a phenomenon when the patient falls down, when the dog barks among others.

(3) Phenomena can be considered a fact that can be seen or experienced but one that the explanation for its existence is not very clear (McKenna et.al 2008). Many things are known to happen and also known to relate to each other. However, the clear explanation behind the events is not always available, and this is called phenomena. On the other hand, I can define a concept remains to an idea in relation to something. This can be related to knowledge of how something works or how to solve something and this has been proven beyond any measurable doubt. 4

Definitions

A proposition, can as well be described as a statement that attempts to explain the relationship between two concepts (Kemme, 2017). (3) This is an important thing because it is often based on some professional understanding that an individual may have and it can form the basis of making a full theory. Lastly, an assumption is something that is accepted to be true even when it is not fully proven. Assumptions may need further proving before it can be considered to be the fact that all people can back with evidence.

Reviewing Seizures

I always encounter seizures phenomenon in clinical practice. This can be defined as uncontrolled electric disturbance that occurs in the brain suddenly. It often happens to patients from time to time, and it leads patients to partially or fully lose control of their bodies and their actions. The uncontrollable jerking movement of the body is also noticeable when a seizure occurs

I always encounter seizures phenomenon in clinical practice. This can be defined as uncontrolled electric disturbance that occurs in the brain suddenly. It often happens to patients from time to time, and it leads patients to partially or fully lose control of their bodies and their actions. (3) The uncontrollable jerking movement of the body is also noticeable when a seizure occurs, and this is most notable for the legs and the hands. There is also notable temporary confusion and a spell where the individual stars into the open. 6

Reviewing Seizures Cont.. (3) Various motional symptoms such as anxiety and fear can be noted on the patient. (4) The idea that epileptic patients are at the greatest risk of seizures is a related concept.

(3) It is notable that seizures are largely associated with patients that are considered to be epileptic. Ideas on seizures are as a direct result of epilepsy has stuck and is generally accepted across many healthcare facilities.

(4) The idea that epileptic patients are at the greatest risk of seizures is a related concept. (3) It is notable that seizures are largely associated with patients that are considered to be epileptic. (4) This is an important factor to consider as many cases over the years be happening among epileptic patients (Martin, & Nahar, 2017). There have also been many healthcare facilities that have made it a concept because they have made the first cause of treatment for any seizures to be looking for epilepsy. The idea that seizures are as a direct result of epilepsy has stuck and is generally accepted across many healthcare facilities. (3) Many training sections of nursing also accept that patients that show these signs are likely to suffer from epilepsy, and nurses are trained to handle the problem as is occurs. 7

Reviewing Seizures Cont.. (3) There is also a notable loss of consciousness among the patients, and this can either be full loss or partial loss of consciousness. It has also been experienced that an array of emotional symptoms can be noted such as fear and anxiety on the patient. The consideration that patients with epilepsy also remains to be at risk of getting seizure remains to one related concept.

(3) There is also a notable loss of consciousness among the patients, and this can either be full loss or partial loss of consciousness. It has also been experienced that an array of emotional symptoms can be noted such as fear and anxiety on the patient. The consideration that patients with epilepsy also remains to be at risk of getting seizure remains to one related concept. 8

Reviewing Seizures Cont.. It is evident that indeed seizure is quite associated with epileptic individuals. It is essential to consider such an idea because in years now, this has been the case among those suffering from epilepsy (Martin, & Nahar, 2017). Other than this being the case in many years, several healthcare centers has also made this a concept based on the many cases of seizure treatment be similar to that of epilepsy.

It is evident that indeed seizure is quite associated with epileptic individuals. It is essential to consider such an idea because in years now, this has been the case among those suffering from epilepsy (Martin, & Nahar, 2017). Other than this being the case in many years, several healthcare centers has also made this a concept based on the many cases of seizure treatment be similar to that of epilepsy. Thus, this same idea that there exist a correlation between seizure and epilepsy has remained and have been accepted in various healthcare centers in the whole nation and probably worldwide. A number of training sections of nursing do also accept that patients who indicate any of the seizure signs are likely to suffer from epilepsy, and nurses are trained to handle the problem as it occurs. 9

Reviewing Seizures Cont.. The proposition related to this is that, both epilepsy and seizure are related in certain ways. This remains an essential proposition to help in setting a stage to be able to understand the existing relationship between seizure and epilepsy conditions experienced by various patients. There exist a lot of cases which has been experienced in many years which has help establish the concept that many of the people who suffer from seizure are also considered to be having epilepsy. The relationship between the two has been established as a result of many cases in healthcare facilities.

The proposition related to this is that, both epilepsy and seizure are related in certain ways. This remains an essential proposition to help in setting a stage to be able to understand the existing relationship between seizure and epilepsy conditions experienced by various patients. There exist a lot of cases which has been experienced in many years which has help establish the concept that many of the people who suffer from seizure are also considered to be having epilepsy. The relationship between the two has been established as a result of many cases in healthcare facilities being solved as a result of diagnosing epilepsy among the patients that are affected. (3) Over the years, it has also been established that if an individual suffers the seizures repeatedly, the most likely diseases that are affecting them is epilepsy. There are also many types of seizures that people experience, but epilepsy remains to be the most common among individuals experience. Based on this, I consider the idea that seizure is related to epilepsy as an accurate proposition and it remains to be right. 10

Reviewing Seizures Cont.. Lastly, there is an underlying assumption that epileptic patients do not get seizures intentionally. This is an assumption that is held to show that patients that are epileptic cannot control the seizures that they experience and that they are simply experiencing the effects of having the disease.

The assumption is that it is impossible to fake the seizures that people experience and that all those that experience them get them natural without any effort. It is also accepted in the nursing community that seizures come largely.

Lastly, there is an underlying assumption that epileptic patients do not get seizures intentionally. This is an assumption that is held to show that patients that are epileptic cannot control the seizures that they experience and that they are simply experiencing the effects of having the disease. The assumption is that it is impossible to fake the seizures that people experience and that all those that experience them get them natural without any effort. It is also accepted in the nursing community that seizures come largely. This same idea considered an assumption that there exist a strong relationship between Epilepsy and Seizure has provided a good basis to develop theories in relation to both epilepsy and seizure. 11

Forming a Testable Theory Cont.. Based on the above analysis, any health care practitioner can be able to conclude that indeed both epilepsy and seizure remain to be relate directly. Considering that, there exist infections, which can be the cause of seizure, the generally accepted idea, and the concept is that, this whole condition is directly related to epilepsy. (5) In many healthcare centers, clinical officers have proven this right and thus it remains a generally accepted fact (Mill, Allen, & Morrow, 2016).

Based on the above analysis, any health care practitioner can be able to conclude that indeed both epilepsy and seizure remain to be relate directly. Considering that, there exist infections, which can be the cause of seizure, the generally accepted idea, and the concept is that, this whole condition is directly related to epilepsy. (5) In many healthcare centers, clinical officers have proven this right and thus it remains a generally accepted fact (Mill, Allen, & Morrow, 2016). 12

Forming a Testable Theory

There are also many types of seizures that individuals can suffer, but it is notable that the largest types of seizures are caused as a result of epilepsy. This also happens because in cases where the epilepsy is not treatable by medicine, then a surgical operation helps a person to recover and become even better.

There are also many types of seizures that individuals can suffer, but it is notable that the largest types of seizures are caused as a result of epilepsy. This also happens because in cases where the epilepsy is not treatable by medicine, then a surgical operation helps a person to recover and become even better. 13

Conclusion

(2) Conclusively, People are capable of doing more work extremely well in handling and helping patients recover fully by the help of theoretical foundations of nursing. With reference to the seizures phenomenon that I encounter in any clinical practice, the theory one can conveniently come up with is that, seizure patients tend to have a high probability of suffering from epilepsy. Utilizing the four items discussed above, it is possible to create the foundation of a theory subject to be proven false or true in the real world and that epilepsy and seizure remains to be directly related.

(2) The theoretical foundations of nursing can help individuals to do complete work in handling the different healthcare patients and helping them recover. (4) In the case of seizures, one can form a theory that individuals suffer from seizures are most likely to be suffering from epilepsy. (3) Using the four items, it is possible to create the foundation of a theory that can be tested in the real world to be found to be true or not true. With the consideration that was made about the phenomena, concept, proposition, and assumptions, one can conclusively say that seizures mostly happen as a result of epilepsy. 15
