

Self-Reflection

Write a short 1-2 page paper reflecting on your thoughts about electronic discovery, what you have learned this semester and the challenges that you might face in your career and personal life that relate to electronic discovery.

1. What were your perceptions about electronic discovery before taking course? What issues/challenges were you aware of or had already faced? Have you already confronted any issues related to electronic discovery in the workplace?
2. What were the most important aspects of the course for you in thinking about electronic discovery? What was less important?
3. How did the course impact or influence your thinking about the legal system in the U.S. versus what other countries have in place, especially as it relates to electronic discovery? Are you now more concerned or less concerned about the way that the U.S. provides protection for people's information/data?
4. Did you change any of your activities/behaviors/practices because of what you learned in the course? If so, which ones and why? Or did the course provide some comfort to you because it affirmed the approaches you already take when you create, share or access electronically stored information?
5. Is there additional information and/or other resources you would like to know about regarding electronic discovery? How will you use what you learned in the course in your future career and/or personal life? Any final thoughts about the course or about electronic discovery?
