

Provide an overview of the risks when setting up a global supply chain for a new electronic system to be used for patient monitoring in hospital intensive care units (ITUs). The system will be designed, assembled, and tested in the UK. The system has a significant software element that is to be developed in India. Electronics will be imported from several Asian countries. The system will be sold world-wide and will need maintenance support for at least 10 years. Upgrades will be expected. Use diagrams and flow charts to explain your answer.
