Data Gathering Tools

Data plays a critical role in decision making, therefore, to propose wireless laptops in clinical service lines, it is important to collect data from different sources before arriving at a conclusion. Several tools are available to collect data for instance the focused groups, case studies, questionnaires and interviews (Chapel & Wang, 2019). Furthermore, these tools are very resourceful as they help in gathering the required data to help make informed decisions in the clinical service lines. Focused group discussions comprise of a collection of individuals from similar backgrounds or experiences to discuss a particular subject. This method will be used by the management in having people discussing the demand for wireless laptops. The group could be the employees or managers in the clinical service lines.

Questionnaires and interviews are crucial in collecting data from individuals working in the organization. Thus, with questionnaires, information can be obtained from the questions developed about the wireless laptop. Furthermore, people involved in the use of laptops will be essential thus questions of critical interest developed and be given to the required employees. Interviews are also essential tools used to resource information from the respondents (Schobel et al., 2016). Individuals involved in the interview will be asked questions concerning the use of wireless laptops. Besides, getting more information from reliable sources such as the users of the system will help make informed decisions.

Finally, case studies are among the most important tool because it provides information according to similar cases used elsewhere. Although the implementation of wireless laptops is new in clinical organizations, it may have been used in other areas differently, hence through understanding how it was implemented, managers can be able to make the right decisions concerning the use of wireless laptops without repeating the mistakes done in other cases.
