Overview of Child Mental Health: Aggressive Behavior

Overview of Mental Health and Intimate Partner Violence*Intimate partner violence and aggressive children*

Table for a Secondary Source	
What is the purpose of this source's information?	The main goal of the source is to assess the exposure that children are exposed to when it comes intimate partner violence.
Who is the most appropriate audience for this information?	The audience that is appropriate for this source are partners who engage in acts of violence that affects their children.
What information is provided by this source?	This source highlights some of the challenges faced by children when it comes to intimate partner violence.
What do you conclude from this source?	Based on the information in the source, it can be concluded that the relevant risk factors can be easily identified through the expansion of knowledge regarding children outcome and the interventions to be adopted.
What cautions do you raise about the limits of this source?	The article has a significant limitation involving the use of cross-sectional design that limited casual prediction.

What particularly interesting/valuable things could a reader learn from this source?	From the article, the reader can learn more about the aggressive behavior that most of the young people after exposure to violence

Video Games and Child's Aggression and Mental Health

Violent and non-violent video games and children mental health

Table for Primary Source	
What was the purpose of the study?	The article's goal was to generate data regarding implications of video games on children's mental condition.
Who did the author use in the study?	The authors of the study mainly sampled studies that have been conducted regarding the effects of gaming on children's mental health. The authors sampled 101 studies.
How did the study produce data for research variables?	The study came up with the data for the research based on the application of meta-analysis of the sampled studies.
What were the major steps in performing the study?	The study mainly applied steps of meta-analysis that led to the findings that have been realized. The analysis involved assessing of the studies based on the different variables that they covered.

What were the results?	The results of the study indicate that when it comes to the video game causing increase in aggression, the results are $r = .06$ and causing symptoms of depression the results are $r = .03$.
What does the author conclude?	The study concludes that there is no clear links that have been found between video games and aggressive behaviors of children who have mental health issues. Also, the study concludes that there is an ongoing debate among scholars regarding the subject of video game and children mental health.
What cautions do you raise about the limits of this study?	The study's main limit is that the meta-analysis that was used was not able to effectively test for the moderators because of the initial studies on video game violence that were used as sample.
What cautions does the researcher raise about interpreting the study?	The study is not standards because of the lack of the adequate analysis of the significant moderators of video games.

What particularly interesting/valuable things could a reader learn from this study?	A reader can gain knowledge regarding the analysis that have been made by various studies about children mental health and video game violence.

Overview of Child Mental Health Management

Child mental health disorders prevention and treatment

What was the purpose of the study?	The main objective of the article was assessing the prevention and treatment of various mental health disorders
Who did the author use in the study?	The study mainly sampled some of the studies that have been done in relations to the prevention and treatment of mental health when it comes to children.
How did the study produce data for research variables?	The data for the study has been produced through the analysis and discussion of the previous studies that have been conducted on child mental health
What were the major steps in performing the study?	The steps involved the analysis of various literature review that have been done in relation to the subject matter. The steps have involved the analysis of different child mental disorders separately.

What were the results?	The findings of the study indicate that there are various mental disorders that children suffer from such as autism and ADHD. Also, the treatments that have been given to the children with mental health conditions mainly focus on symptom control instead of the long-term effects of life chances.
What does the author conclude?	The author concludes that there is the need to question the use of the resources in detecting the mental conditions that the children have.
What cautions do you raise about the limits of this study?	The caution that I can raise about the study is that it has not used primary data which could have given first-hand information about child mental health treatment and prevention.
What cautions does the researcher raise about interpreting the study?	The researcher has not raised any caution regarding the interpretation of the study and its findings.

What particularly interesting/valuable things could a reader learn from this study?	Readers can get knowledge regarding various mental health disorders that affects children. They could also learn how to treat and prevent some of the mental health conditions faced by the children.

Summary of Findings

Suggestions for the Future Research

What was the purpose of the study?	The goal of the article was focused on the children who have been affected by conflict and their mental resilience as a way of coming up with an effective intervention.
Who did the author use in the study?	The study used already published peer-reviewed sources that had covered mental health of children and resilience in relation to conflicts.
How did the study produce data for research variables?	Data for the study was collected through the analysis of systematic peer-reviewed of both qualitative and quantitative studies that have covered reliance and mental health of the children who have been affected by conflicts.

What were the major steps in performing the study?	The steps used were mainly the inclusion and exclusion criteria. The inclusion criteria mainly adopted studies that reflected on the main objective of the study while the exclusion allowed for the elimination of studies that were not covering the objective of the study.
What were the results?	The qualitative studies revealed a wide range of variations of socio-cultural aspects that affected the impacts of the children's resilience. Quantitative studies revealed that the phase and symptoms of the conflict have affected the mental stability of the children.
What does the author conclude?	The conclusion of the source is that resilience is a complex issue that is effected by time and not by the factors that affect the mental health. Also, it is concluded that there is the need to tailor resilience-focused interventions to meet the specific contexts of their applications.

What cautions do you raise about the limits of this study?	The caution that I find in the study is the lack of primary data. Primary data gives actual results to what is happening as compared to reviewing studies that have been conducted that might be outdated by events.
What cautions does the researcher raise about interpreting the study?	The first limitation raised in the article is that there was no meta-analysis that was done regarding the results due to absence of consistency in the used studies. The second limitation is the flexible definition of resilience. The third limitation is the lack of a strict inclusion criteria that affected the quality of the findings.
What particular suggestions does the author give for future research studies?	The recommendation for future research should begin with qualitative research when analyzing the reliance of children in conflict areas and its effect on their mental conditions.
