Prompt 1

Greetings, thank you for your contribution in the forum. Cultural competence is essential as cultivates trust, eases patient-doctor relationship hence promoting voluntary diagnosis and fastening treatment process (Ward et al., 2018). I am also conversant fatalism a concept of demon manifestation is common in rural Afghanistan where they believe that it for germ infection where they believe in nothing else other than fate. Yes stereotyping an implicate treatment process because culture is diversified and dynamic within a single entity. On my case of research and I am dealing with stunted growth and memory health in East Chicago where records indicate that black children have been more affected than whites due to poverty and lack of access to clean water.

Using co-design to develop a collective leadership intervention for healthcare teams to improve safety culture. *International journal of environmental research and public health*, 15(6), 1182.

Prompt 2

Hello, thank you for your contribution. Human beings as members of society automatically form composition of certain norms. And I agree understanding these norms creates a good rapport between physicians and patients. I also agree if it were not for the assumption that the clinician made, proper diagnosis and immediate response would also have been met with the right treatment and the patient would have lived. The Roman Catholic believers have a different perception of acceptance to vaccines and birth control strategies (Oller, 2017). In

addition to that Iranian culture, believes that some chronic condition such as arthritis and cancer are due to supernatural will and I believe this can as well implicate voluntary diagnosis.

Prompt 3

Hello, I agree with you that COPD is a collective name for more than one condition. Emphysema and chronic bronchitis are the composition that leads to the chronic condition. The pathological are characterized by resistance of air flow within the air pathways hence causing difficulty in breathing (Anzueto & Miravittles, 2017). Apart from smoking as mentioned in your post, COPD can be also caused due to waste that emerges from burning fuel and as the condition in developing nations prevails that there is poor housing hence making the people susceptible to COPD. The signs and symptoms of COPD are attack from shortness in breath, clogged chest, fatigue, weight loss and cough usually with plegm or dry.

Is smoking the main cause of COPD?

Prompt 4

Greetings , thank you for your contribution. Yes I agree you with the nature of emphysema and how it causes the alveoli to burst which reduces surfaces area needed for gaseous exchange makes lung transplant a long term intervention for the problem. New technology with the right installed softwares can be useful in differentiating emphysema from other similar conditions. Early disease diagnosis prompts early medical strategies hence helping in reducing the mortality rate associated with the condition. Devices that can monitor biological changes and that can predict nature of exacerbations are proved to ensure improved healthcare and preventive measures .

Is it possible to discern emphysema from other biological complications through use of wearable technologies?
