The most important aspect highlighted in the first perspective about the body systems affected by COVID-19 diseases is the realization that the virus can damage other body organs and systems. In addition to the respiratory system that had been projected earlier. Research has proven that the virus can affect the circulatory system, heart, central nervous system, renal system, and gastrointestinal system. Consequently, severe illness from COVID-19 infection can lead to devastating organ damages in these body systems. Similarly, another important feature highlighted in this perspective is recognizing symptoms like diarrhea, nausea, and vomiting that were considered normal and not linked to COVID-19 disease to be potentially associated with the virus. Therefore, this realization offers a wider understanding of the disease, adding to the wide range of listed symptoms that people should look out for to combat the virus. Thus encouraging individuals not to ignore and overlook the symptoms.

In contrast, the second perspective about the economic issues involved with the virus is the adverse effects on financial markets and the global community leading to a significant load on healthcare systems worldwide. As a result, there have been untimely deaths, decreased productivity influenced by a hostile supply chain shock. Not forgetting absenteeism from workplaces and reducing manufacturing production activities due to international supply chain interference has negatively affected all economies. Additionally, is the fact that the measures put in place to control the spread of the virus have been driving an inconsistent upsurge in women's joblessness compared to their male counterparts. Since the hardest-hit industries such as food service and retail are over-represented by women and the induced scarcity upsurge broadening the gender deficiency gap leading to the ushering of more women into extreme poverty than men.
