Let me start by thanking you for being bold enough to let us know your desires to work for Google. Majority of us consider Google as one of the best employers to work for due to some of the perceived benefits like an opportunity to expand knowledge and understanding in artificial intelligence. The company is one of the global technology giants that offer better remuneration and job security and a better working environment. You have also indicated that you would consider a coding position at Google.

There are certainly valid reasons why people fear the progress of artificial intelligence. Some border on the issues of privacy, where personal information is accessed and shared by artificial intelligence technologies without consent. In addition to that, artificial intelligence technologies like facial recognition software have been unfairly used to target certain members of society. **However, I feel that you have failed to give sufficient reasons as to why many individuals fear the advancement of artificial intelligence. Watching movies like The Matrix and Terminator is not enough.**

Although artificial intelligence systems have developed, there are certain aspects of our lives that artificial intelligence cannot change. For instance, a machine cannot feel what we feel as humans. In addition to that, I concur with you that taking a job working on artificial intelligence at Google is ethical. Presently, the world is witnessing technological transformation where people are coming up with important inventions in crucial sectors like medicine and surgery. Furthermore, artificial intelligence has enabled us to understand some aspects of our world that we never previously understood. More importantly, even a coding job requires one to adhere to the ethical guidelines underscored in the ACM code of ethics for computer technology professionals. Working on artificial intelligence and getting breakthroughs remains ethical, as

long as one abides by the ACM code of ethics and personal resolves about ethical principles of work.

To sum it up, **it is recommendable that you have highlighted important issues; one is that artificial intelligence cannot change certain aspects of our lives, like our emotions.** **Second is the use of artificial intelligence that violates the ethical procedures** discussed in the ACM code of ethics. In such instances, artificial intelligence is used for the wrong reasons and in a way that destroys the world. For example, artificial intelligence can be weaponized and used by developed countries to impose their will on less-developed nations. This raises questions about the ethical practices in artificial intelligence and working for multinationals like Google.
