The Warning Signs of the Elder Abuse

Abstract

¹² What are the warning signs of the Elder Abuse? By Brittney Young, Elder abuse involves physical, mental, money related to abuse as well as ⁴ includes the violation of a person's rights or else social abuse. The criminals are usually children, additional family members, in addition to ¹¹ spouses. As well as staff at nursing homes helped the living as well as other facilities.

⁴ Preliminary data on causing factors related to the elder abuse suggest that misinformation, the caregiver's lack of considerate of the needs of older adults, social separation, a history of the dysfunctional family relationships, and the psychopathologic factors of the caregiver are important factors for the understanding elder abuse.

¹⁶ The purpose of research on elder abuse and neglect represents a considerable number of difficulties. Additional than displaying methodological as well as down to earth challenges, contemplating abuse of extra established individuals increase impressive ethical and arrangement issues. Facts and assessments were taken, and various scenarios will help support my argument. Elder abuse receives less attention than any other form of abuse. So, from my perspective, we should bring more awareness to this rising issue. From my point of view, everyone should be informed on how to prevent elder abuse. Writing this paper, I anticipate finding exactly when and why did elder abuse starts? And when exactly did this abuse start getting national attention and I also would like to see what plans the world has in place to stop this horrible crime.

Introduction

The topic of discussion today is on the focus of how the society at large has neglected the elderly people who we perceive as wise and gone ahead to make their life a living hell on earth. Can't the community, allow them to enjoy the brief time they are left with on this earth? Can't our grandmothers, grandfathers, and our elderly parents earn respect anymore? Where are the norms that society in the past stood by? The days where the powerhouse of experience was the elderly man and women, and everyone was ready to associate with the older adults. Where are those days when the slogan in schools was, respect the elderly? Do people who perform these crimes take time to be in the shoes of the abused elders? Do the criminals forget that very soon they will be old themselves? The discussion will take into consideration the abuses that the more aged men and women go through in the current life, be it physical, economic, and mental abuse to the more aged people. The number of crimes on the elder is shooting to the skies at a very fast pace, and its time that we learn to tame it. The caregivers are not exempt from the misuse of the elderly persons as much as some are paid to provide the service of caring to the old.

The physical the sexual abuse of older people is a common form of abuse that the ordinary old men and women are exposed to daily. The abuse is most likely because their energy of resistance with age has gone down. They can't resist the force of the fierce young men and women who are eager to abuse and misuse them. The signs of the abuse are usually very much out-looking as they can easily be seen. An unexplained bone breaks and bruises is a sign that the elderly person was trying to resist some excessive force towards them. In no case can someone get into a situation of getting injuries and fractures if he or she is not subjected to an excessive force (Plati et al.2016). Sores and burns are another sign that the caretaker was mistreating the

elderly person. Sores can only be attained from a struggle. In ordinary cases, one can acquire sores when he or she is performing a heavy-duty, but what of this elderly person who no longer has the energy to perform such duties?

The sexual abuse to the elderly is also another common abuse that our society should be protecting them from. A situation where the elderly has an unexplained sexually transmitted disease is a clear indication that someone was assaulting the old man or woman sexually. Who would have caused sexually transmitted to a sexually inactive person? Such situations call for further investigation into the case. When an older person gets bruises on the thighs and the genital parts, which is also an alarm to check on a possible cause from a sexual assault on the elderly person. Bleeding and pain on the genitals majorly when one is going for short calls is a sign of a possible situation in which the elderly were sexually abused (Vertejee, 2015).

There are also cases of neglect that elderly persons tend to face in their lifetime. There are many clues that one can look into to realize that the caregiver or the family member is neglecting the older person. A lack of basic needs like food water and clothing to the old person is a sign that the care is less toward the respective person. Most times, the neglected person will be having old clothes that, in most times, are not clean. The old man or woman will smell bad because, over a long time, he or she has not been bathed (Dong, 2015). The body will look malnourished because the old person is given food scarcely, or the diet given is not balanced to enhance the healthy-looking body. A sign of severe bedsores and ulcers is another sign of neglect towards elderly people. Bedsores occur because the older adult has been left on the bed for a very long period. The sores develop out of the excessive pressure on one part of the body for a very long period. Ulcers will result in the little food they get as the acids will burn up the

stomach resulting in the ulcers. The other sign of neglect is missing intermediate care like medication, a sign that there is little care towards the old from the family and the caregiver.

The elderly also go through emotional trauma. Like anyone else, old people have emotions. Emotions will want someone to care. When care is not given to the emotions, then it becomes heartbreaking. The elderly can be emotionally abused in very different ways. The elderly tend to have a weird change in character in response to this emotional trauma from the caretaker, and the family believed to abuse them. When an elder is withdrawn from family activities and events, he or she feels neglected, and in response, they feel hurt and no longer accepted in society (Dong, 2015). The family members or the caregiver at times become so aggressive with they handle the elderly this makes the older adult feel no respect as much compared to the time before they were aged. They also seem to be an excessive control from the caregiver to the older adult in a case of emotional abuse. The older adult is never given a single say over anything as much as the old person might be right. These treatments leave the old person depressed and stressed because of the feeling that society does no longer embraces them or accepts them like before.

The possibility for elderly abuse, or the neglect and physical and emotional abuse of dependent older people, makes one really troubling characteristic of older adulthood. Negligence may take the form of withholding food or medicines, not altering bed linens, or going to provide appropriate sanitary conditions. Personal abuse may appear as striking, squeezing, shaking, punching, or kicking the old. Emotional abuse may make this form of verbal threats, cursing, and abuses. Estimates are that about 5% of American older adults have maltreatment every year.

The other form of abuse includes financial abuse to the elder people in society. There are many situations and signs that can imply that the elder person is being abused financially. A case

of food and other basic needs lacking in the house while the old person's financial records are positive or he or she still earns a lot from their pension scheme is a sign of financial abuse to the elderly (Dong, 2015). In such a case of the basics missing in the house, then there is a higher chance that someone is taking all the money for themselves without caring for the older person. Another case is where the older people are being overcharged of services offered to them by society. In most times, many people take advantage of the old by overpricing products for the old people in a case where the product is cheaper to make more profits. There are cases where because the elderly cannot understand the financial transactions, then the service provider takes the advantage to earn more than the expected amounts from the older man or woman.

Many reasons make the older men and women of society be so exposed to the abuse that they face daily. Most times, elderly people are in an inferior health condition living them susceptible to the abuse from healthy human beings. Another predisposing factor to the abuse is the isolated life that some of the elderly people lead (Abdelmoneium& Alharahshesh, 2016). Abusing or attacking a single defenseless person like an older person is more comfortable than attacking a normal energetic man or woman. Most old people are isolated because most time, their kids have grown and had families to attend to together with being kept busy at their workplaces. The kids tend to visit occasionally over a while. The other situation where the old man or woman can be abused is when the caretaker or the family members are drug abusers hence reciprocating their misery to the old people in the family.

5 Much time's country looks at the old as being ineffective, not the technology confidence, 5 mentally ill, physically sick, in addition to ugly because of wrinkles. There was the issue of old mistreatment at nursing homes because of some of the old not being powerful enough to push back or else mentally confident of speaking up for themselves. Over these years the aging

population suffered from old mistreatment, making prejudice, in addition to years discrimination.

From many reports of elderly abuse and discrimination over those years the elderly and Malnutrition in any age, food is critical to sustaining well-being along with enhancing quality of life. However, achieving better food will be particularly challenging for the older, the fastest-growing part of America's population. Some factors, including physical changes, changes in nutritional demands, sickness and personal limits, food-medication interactions, depression and sadness, and food insecurity, are frequent cases of malnutrition in the elderly.

Failure of physical and emotional closeness is significant and frequently dismissed as the source of suffering for the elderly. Most older patients need to talk about intimate matters with their doctor, according to the Global survey of sexual Attitudes among males and women ages 40 to 80 years.¹⁸ Surprisingly, Yet geriatricians frequently fail to get the sexual history of their patients. In one survey, only 57 percent of 120 geriatricians surveyed routinely had a sexual history, even though 97 percent of them thought that patients with sexual issues should be done further.

Security of children and teenagers, women, and older people. Some nations and foreign organizations have acknowledged the harmful effect of physical abuse, sexual assault, exploitation, and work on the psychological health of children and teenagers. These topics should be considered an essential element of mental state governance. For instance, the government will be produced that ensures early detection of child abuse by health professionals and quick connection to the legal system

Literature Review

It is meant to review other articles that have content in relation to the abuse of the elderly and how the different authors handle and discuss the issue. Daly and Jorgest describe the

discusses on the types of elderly abuse, stating the physical, emotional, and neglect and go ahead to describe into detail the side effects after they carried out their research. Sexual assault on the elderly is briefly covered.

The national research council research (2003) also focuses on the elderly mistreatments. The discussion covers the intentional actions that may be considered as an abuse to the elderly. It analyses how the caregivers fail in the provision of basic needs to the elderly people. The research also addresses what makes the elderly vulnerable. Adult ²abuse charges are categorized as assaultive crimes, even when this abuse is from negligence. Some states have the name of elder abuse when charging the offense. Others use headings like trauma to the elderly or make enhanced punishments under their attack statutes for older victims. Elder abuse includes careless, deliberate, or knowing physical loss to the older person. The older individual is anyone that age of 65 and above. These statutes are designed to protect especially dangerous victims and therefore tend to be wider than standard rape statutes.

¹⁵The center for evidence-based medicine (2009) focused on the grading schema that was used to make recommendations towards the abuse of elderly people. It focuses on the level of evidence ¹⁰due to the respective elder abuse. Different grading levels were ¹⁰used in relation to the research. Elder abuse has been present in the community from previous periods. Information on elder abuse may be seen in Shakespeare's writings and writing, and likewise in Greek mythology. Despite its' continual existence throughout experience, it is just recently that serious attention has been made to old violence. The primary reason for the recent understanding of the old issue is the increasing number of aging Americans (Human center for Victims of Crime).

The Warning Signs of Elder Abuse

Description of the population and sample

The population is the area or objects of interest in relation to the research and statistics that are being carried out (Puechmaille, 2016). The population is the affected or the area onto which the topic of concern affects, and true information is yet to be extracted to know the scale of the effect. The population was chosen for the respective research in Oklahoma. The rural part of Oklahoma is a place with a large number of people who various incapacities, which include the abuse to the elderly people. The area is made up of very many people who are poor and tend not to have a lot of infrastructure leading to people being very unable to service their routine life. Rural Oklahoma is made up of a large population that rarely applies the rule of law hence bringing a high probability of the crime against humanity. An area with large cases of poverty majorly forgoes the law to achieve a few advantages over other people. Hence, the elderly being less defensive will be exposed to such abuse. A sample is a section of the whole population that will give the average results for the other population (Puechmaille, 2016). The sample selected for the respective research is the Arkoma town. The population usage will be costly compared to the usage of the sample; that's why the research will focus on Arkoma.

Factors that improve or determine population development can be divided into two categories from how each element is impacted by the amount of people occupying the given country or the population's density. ⁹ As population size approaches this carrying power of this situation, ¹ the level of density-dependent factors increases. For instance, competition for resources, predation, and rates of transmission change with population density and will finally decrease population size. Different elements, like contamination, seasonal weather extremes, and natural catastrophes hurricanes, fires, droughts, floods, and volcanic outbreaks affect populations regardless of their concentration, and will restrict population development only by seriously reducing the amount of people in the population.

There are various factors that affect population concentration, and these are much studies of population geographers' survey, too. Such elements may refer to the physical environment like climate and geography or be associated with the social, economical and political environments of the environment. For instance, countries with rough climates like California's Death Valley area are sparsely inhabited. By comparison, Tokyo and Singapore are densely inhabited because of their moderate climates and their economical, cultural, and political growth.

Population density is frequently impacted by various factors, which, coincidentally, are many studies of population geographers' survey. These elements tend to refer to the population's physical surroundings, e.g., geography and climate. For instance, areas with rough climates, e.g., California's dying Valley, are thereby sparsely populated. Other factors that affect population density may also be associated with the region's political environments, too, as the cultural, economical society of the country. For instance, Singapore and Tokyo have moderate climates with growing political, cultural, and economical and are thereby densely inhabited.

Factors that improve or determine population development can be divided into two categories from how each element is impacted by the amount of people occupying the given country or the population's density. ⁹ As population size approaches this carrying power of this situation, ¹ the level of density-dependent factors increases. For instance, competition for resources, predation, and rates of transmission change with population density and will finally decrease population size. Different elements, like contamination, seasonal weather extremes, and natural catastrophes hurricanes, fires, droughts, floods, and volcanic outbreaks affect populations regardless of their concentration and will restrict population development only by seriously reducing the amount of people in the population.

These elements tend to refer to the population's physical surroundings, e.g., geography and climate. For instance, areas with rough climates, e.g., California's dying Valley, are thereby sparsely populated. Other factors that affect population density may also be associated with the region's political environments, too, as the cultural, economic society of the country. For instance, Singapore and Tokyo have moderate climates with growing political, cultural, and economical and are thereby densely inhabited.

The types of samples that could have been used include ¹³ random sampling, systematic sampling, convenience sampling, and stratified sampling (Etikan & Bala, 2017). The stratified sampling was the model chosen for the respective research title. It seemed to be the most convenient method and easy to use in the topic selected. The stratified method of sampling divides the entire population into groups called the strata. The strata are grouped in relation to the classification in characteristic and not generally the geographically. The selected population was subdivided in relation to the ability in terms of wealth to individual service lifestyle and the population that had a large number of the old people (Etikan & Bala, 2017). A sample of Arkoma was selected systematically to allow give the best of the result in relation to the whole research is concerned. Arkoma has got an average poverty rate of 15.8 percent. The population

of Arkoma is approximately 2000 people that will be easy to handle when doing the statistics compared to the other zones that have very big numbers.

The written process of consent will be used upon the research because it is easy to use. In this process, the researcher explains the research to the potential audience which he or she expects to source information from. The audience will give the researcher attention because the consent from the federal regulations authorizes for the research to be carried out. The consent will also prove that the research is not a lie. The consent document will be used to guide the verbal description of the content of the research to the respective audience. The guide and consent ensure for the meaningful exchange between the researcher and the audience from whom the information is going to be collected.

There are many tools use up in data collection, which includes questionnaires, interviews, records, and many more instruments used up in the data collection. Questionnaires were the preferred method of collecting data because the audiences are the aged and the people who witness the abuse on the early in their workplaces, homes, and neighboring environs. The means was the best because questions were structured to touch directly on the critical focus of the research. Most people at this current time as much as they are poor can read, understand and write. The questions were also structured to be direct and to the point. The questionnaires are meant to cover at least half the population of the place to find relative answers to the whole study. The cognitive interview was carried out as a pretest to the questionnaire to see how the concerned audience is going to respond to the mode of data collection (Willis, 2016).

After the pretext has been done with its respective procedure, then the questionnaires were administered to the audience. Visitations were made to homes and hospitals to submit the questionnaires to any sane adult that was in the zones. The other place of administration of the

questionnaires with a pen to the people at workplaces and the bus stations so that the people can express their opinion through writing. The values and opinions of the people were taken in and recorded in numbers to ensure the rate of witnessing and occurrence of the Abuse. The questionnaires also allowed knowing the rate of the reporting of such cases to the authorities. It also allowed knowing of means to counter the abuse of the elderly.

Results.

The population of the area of focus showed positive results in relation to the research that was being carried out. The objective was to find out the rate of the increasing occurrence of the cases of elderly abuse. The result showed that 6 out of ten approximately 60% of the people gave their opinion that they have ever experienced the elderly abuse cases in person or as witnesses. Seventy percent of the aged person people have personally experienced the elderly abuse from the community they interact with. Fifty percent of the medium age persons and the youth have also witnessed the elderly abuse case in the hospitals and the community they regularly interact with. There is also a high rate of elderly abuse in the middle and lower class environments compared to persons with a rich background. The poor elderly persons are mistreated because of a lack of enough finances to service the daily needs and even to hire a caregiver. The highly affected persons in elderly abuse are the women who are majorly physically incapacitated during their later ages.

Like some people have personally known, being a teenager or young person is no easy task. Yet, what most people fail to come to terms with is that these old suffer from this similar difficulty. Older people must learn to adapt to the fundamental character changes that they later make themselves. The replacement may be extremely challenging for some because it usually revolves around the loss of status, prestige, and duty.

Our aging population, and that emphasis on helping those elderly stay at home for as long as possible, think by that moment people follow old care they are older and sicker than before. In half of the people living in elderly care day have dementia, depression, or another mental state or behavioral status. Research consistently shows more people need to be at their own houses as they change. At the 2018-19 plan, the government announced an additional A \$ 1.6 billion over the next four years for the extra 14,000 family aid Packages. These give the agreed set of services to meet the particular needs of older Australians who need to stay at home.

Statistical data also shows that the rate of increase in elderly abuse is growing at an alarming rate that will need special intervention. Data collected also showed that most of the cases in the abuse of the elderly are not reported with like only three out of ten cases being reported. Of the reported cases to the authorities, only twenty percent of the cases are followed up seriously and the suspects arrested and convicted. Physical abuse is reported having the highest percentage in the elderly abuse closely followed by the sexual abuse evident from the data fed in by the aged persons. The financial abuse reported the minimum ratings in the abuses to the elderly persons. The data illustrates how old persons are financial safer compared to their safety in the physical and sexual abuse. Statistics also showed that the significant abusers of the aged persons are the people in the early twenties to the early forties. The rates of the abuse are very highly reported in rural areas compared to the urban areas showing the urban areas are a bit of considerate on treating the elderly persons well. There were high cases of abuse to the elderly at homes compared to the hospital and the care zones for the elderly. The cognitive interview carried out as a pretest to the questionnaire to see how the concerned audience is going to respond to the mode of data collection(Willis,2016) showed that the audience would be positive

in response to the test. As much as the response was positive, there were challenging moments with some of the people avoiding the questionnaires and probably lying.

As the population grows in the environment, the population may have the consequences of increased densities. In the given environment, is the highest population size of the species that the environment will maintain is called the carrying power. Carrying power is defined by the quantity of available resources (food, environment, water). As the concentration of people at the population increases, these people must be competing for specific resources with each other (one species, or intra-specific competition) or with different species (interspecific competition).

Besides population, human action may also change that the food chain within the ecosystem. When humans produce noise in one population it might only change a couple of species. But this disturbance in those species so involves even additional species that interrelate through it, branching out at the domino effect-like disturbance. The adding up of the invasive species to the environment will lead to the new characters for indigenous species that develop to utilize them. Instead, the separation or else change of the species in the ecosystem can decrease the roles that other species may take.

Adult ²abuse charges are categorized as an assaultive crime, yet ²when this abuse is from negligence. Various states have the name an ²elder abuse when charging the offense. Others use headings similar to trauma to the elderly or make improved punishments beneath their attack statutes for older victims. The elder abuse includes careless, willful, or knowing were a physical loss to the older person. The older individual is anyone that older personage of 65 and above. These statutes are designed to protect especially dangerous victims and therefore tend to be wider than standard rape statutes. Elder abuse statutes do not hold complaints to injuries, which are the result of the primary attack or touching of an older person.

These acts which represent the elder abuse charge sometimes coincide with other crimes like rape, spousal ¹⁴abuse, as well as financial exploitation of the ⁸older. Since some ⁸state legislatures are worried about the danger of older victims, some states allow the suspect to be prosecuted for equally charges, not only the one that fits most excellent. Offenses will end result within the ⁸stacking of crimes, which means still additional jail time. The elder abuse accusations may have different effects ²outside of the criminal field. If the suspect sustains a government license associated with the care of the others, similar to nursing or else family healthcare, then the suspect's permission would possibly be revoked. If the suspect, in the position to acquire or else get a gift from the older person upon death, then he would also become disqualified from having this inheritance.

Population ecologists usually divide the elements that impact the magnitude of populations into density-dependent and density-independent elements. Density-independent elements, e.g., weather and climate, maintain their influences on population size irrespective of the population's concentration. In comparison, the consequences of density-dependent elements increase as the population increases in size. For instance, some diseases move faster in populations where people sleep near one another than in those whose people go further apart. The components of the elder abuse charge include evidence that: A person is an older person, an act or else omission happened, along with that the person had some loss as a result. This act may be a direct otherwise deliberate attack onto the older person. The neglect may include an extensive array of failures including not offering adequate food, medical aid, or medical assistance. Various elder abuse complaints based onto omissions also need evidence that the suspect assumed several caregiver uses at the older person.

Conclusion

The society has, for a long time, embraced and indulged in these heinous acts of mistreating the aged who, for a long time, are believed to be the wise men of the society. The people forget that at one time in their lives, they will be aged and be mistreated if they don't stand against the elderly abuse. The reporting to the authorities on cases of elderly abuse should be prioritized. Laws against elderly abuse should be created and strictly followed to ensure that aged persons live the remaining part of their lives in peace. The community at large should be educated against the use of their prowess and energy against the elderly persons. The elderly abuse should be a thing of the past and never to be tolerated in any part of society. To meet the safety interest in the older age, separate lives in the community.

Similarly helplessness in the moment of first compels him to stay in society. The food, shelter, passion and affection demand compels him to stay in the community. Therefore for the satisfaction of human needs person lives in community. So it is also true that not just for the world but also for the fulfillment of his wants and necessities person lives in community.
