The Global Food Crisis

Why GMO's are good

Genetically Modified Foods

The global food crisis is a broad topic. Millions of people every day go without food. So when choosing a specific issue that has to do with global food crisis it needs to be important. I need some type of theme that could not only make a difference but would open the reader's eyes.

Genetically Modified Organisms are manipulated foods that benefit the human race. These foods can be grown bigger, faster, and higher in nutrients along with so much more. I know that GMO's are a great way to help suppress world starvation. This is why the audience needs to know the facts and benefits of these foods. This topic is a great choice because of the popularity of in the farming industry. The farming industry has been using Genetically Modified Organisms for a while now. It is time to inform the remaining population about these organisms. This way we can help prevent world hunger

I am going to research about GMO's in the farming industry. GMO's are very controversial and are a rising issue in the world. The majority of the population think genetically modified foods are bad. Yet these organisms are in high demand in all kinds of farms. Genetically modified organisms have pros like, they can reduce emissions, the need for herbicides, pesticides, and how manipulation can factor into helping third world countries. The pros of the organisms will help me discuss topics and solutions to

- What are genetically modified organisms?
- Why are GM foods produced in the first place?
- What are the main concerns for human health, and how can it be resolved?
- How safe are GMO's?
- What kind of foods can and are genetically modified currently?

These questions are critical to the learning of a proposed topic. By answering these types of questions, I can help the reader understand my topic.

Using correct information is critical to my topic. I will need to use accurate academic journals and articles to ensure this. I can make this happen by using sources like the Hunter library, organizational websites, and journals. For specific explanations, I will be using the IRT, EPA and naturalrevolution.org. These organizational and government websites have studies that I will be using in my paper.

In conclusion, GMO's have positive outcomes for society. This information I am giving you makes GMO's the farming of the future. Uneducated individuals leads to a disastrous world, and that is no good. By educating the population, I can explain the importance of GMO's and why we need to support them and their benefits. By doing this, we can eliminate faults in our farming and prevent starvation. If we cannot do this then millions of people will continue to suffer. When our own human race suffers, so does the future of our food.
