Introduction

There are various arguments put across against the bottled water in Canada. The report will carefully analyse the argument against the bottled water in Canada. Furthermore, the report will analyse the article's aim by clearly supporting its argument from the evidence in the article. Similarly, the report will analyse whether the bottled water is healthier because it comes from the glacier and mountains. The study will also give detailed evidence to support whether bottled water is healthier because of its source (Deng et al., 2021). The connection between the bottled and global warming will also be discussed in detail while supporting the article's arguments. Finally, the report will conclude by paraphrasing the quotation from the article.

The main message of the article is to campaign against the use of bottled water in Canada. The report provides adequate evidence against the use of bottled water in Canada. Furthermore, the article explains the adverse effects and the possible risks of using bottled water. The report concludes on the adverse economic and environmental effects of using bottled water in Canada. In conclusion, the report advocates against the use of bottled water in Canada by promoting other water sources such as tap water and water from natural sources such as rivers and lakes.

I am afraid I have to disagree with the idea that bottled water is healthier than tap water. The safety of tap water is constantly checked, unlike the bottled water. This article does not support the use of bottled water. Furthermore, this article provides more evidence why the tap water is safer than the bottled water. The article argues that the bottled water is not constantly checked for germs and other contaminants. On the other hand, tap water is checked daily to assure the consumers of the water's safety. Additionally, plastic bottles' use

to carry water increases the chances of contamination from the plastic composition, which can cause health issues to the consumers.

How bottled water is connected to global warming

The bottled water is primarily concerned with global warming because of the use of plastic bottles. The manufacture of plastic bottles leads to the emission of poisonous gases into the atmosphere leading to environmental pollution. These gases affect the ozone layer and hence causing global warming. Lastly, improper disposal of plastic bottles causes environmental pollution hence contributing to global warming.

The author is concerned about Dasani and Aquafina's source because he wants to know if it is true if they get the water from glaciers and mountain streams, as they say. However, the author discloses that the Dasani and Aquafina water companies cheat the consumer to fetch the water from mountains and glaciers. Instead, they pack the municipal water and sell it to consumers. In this case, the consumer is cheated because their taxes are used by the municipal council to generate water for society. Hence the consumer pays twice for the water by buying the bottled water.

Paraphrase about prices of water

Bottles water is an example of price gouging because those companies selling bottled water do not get their independent sources of water, instead they use the water provided by the government through the municipal council.

Paraphrase About sources of water

This statement talks about the wealth of Canada concerning water resources from natural sources.
