The medical community in response to the opioid epidemic should be trying to put more effort into the tracking of the nonfatal substance drugs and fatal substance drugs that cause overdose cases. By doing so would hep the community as a whole enhance care for the people who have opioid issues and the ones who risk opioid overdose. Programs for monitoring prescription drugs can be improved that way health systems can be implemented and intervened for those programs. By partnering with public safety they can also create prevention activities and surveillance teams for programs with dangerous opioid usage.

Something I think are good ideas that can help prevent and fight against the opioid epidemic would be better improvements to addiction prevention's and the public health services. Another would be better data collection, being able to keep records of what is happening with patients or effects of opioid usage. The act of reversing the opioid drug and finally the act of better research on the opioid drugs being given to the population of people. I think drug companies should be held responsible for the current opioid epidemic situation we are in. I believe it is also on the government as well. Both parties are selfish enough to only care about making money and bettering the lives of themselves rather than the lives of the community they serve.

Pill mills are clinics that are used for the population and prescribe large quantities of medicine. They usually have one physician or only a few working with hundreds of patients. This in itself is a terrible idea because pill mills can be used to gain drugs for pleasure, cause addiction, provide wrong information, and can be used for a lot of unreasonable methods of use.

Something in the show that caught my attention was when they talked about the pill mills. I have never heard of them and I see that they are all over the place. It made me change the way I percieve most physicians and how they would do anything just for money.
