Climate Change Policies, Problems, and Solutions.

Literature Review

As to Palomo (2017), the climatic changes are becoming evident in the high mountain areas being that the mountains are depicting the signs of climate change. The signs of the climatic changes are showing in the way tourism has declined in most of the countries that had mountains as a source of tourism attraction. The tropical glacier has been seen to disappear making the white attraction to the tourism met away.

Fatorić & Seekamp's (2017) focus is on how the climatic changes are posing a big threat to cultural preservation and heritage. The climatic changes harm the social and economic factors the communities that depend on the natural systems to maintain their way of style. The lifestyle of the different communities is forced to change to the fact that the nature that they depended on nature to carry out their policies.

West African is very disposed to the climatic changes as the countries within West Africa are experiencing the climatic shocks like the droughts. The droughts are resulting in the food shortage as the poor climate is leading to the poor weather that does not support the agricultural activities. The climatic changes result in changes in the way people carry out their farming activities to reduces the chances of losses (Zougmore et al. 2016).

The current changes in climate continue to challenge the knowledge and the risk assumptions to the disaster that are related to weather. The public health officers are on the verge of developing an epidemiological approach to mitigate the changes in weather-related disasters (Runkle et al. 2018). Indonesia falls as one of the countries that are disposed to the effects of the climatic changes.

The vulnerability of Indonesia's ⁴ assessments from hydro-meteorological and geophysical hazards is ⁴ needed (Djalante, 2018). the areas in Indonesia like beyond Sumatra and Java island should be examined to reduce the chances of the Indonesians losing their lives and way of life because of the changes in the climatic changes. The area is so frequented of natural disasters like earthquakes and flooding.

² After the Paris Agreement on Climate Change in 2015 has changed the mode of governance resulting from the ongoing climatic changes. The policies that are initiated by the different governments have been set to consider the weather including ³ the long term effects of the policies on the climate. The call or the multidimensional decisions in solving the climatic problem as the many stakeholders are called upon to come in assist in resolving the climatic changes (Gonzales-Iwanciw et al. 2020).

The extinction of the different species is a result of the continuous changes in the climate resulting in some of the animals and plants failing to survive the harsh climate (Foden et al. 2019). the population of some of the species is declining because of the continuous climatic changes. The species result in the need for the conservation forcing the people to change on how they manage such species reducing chances of never seeing the species on the face of the earth.

The climatic changes are leading to a very negative impact on tourism activities in different states and countries (Scott et al. 2019). The areas that are exposed to the high chances of tourism extinction due to the climatic changes are Africa, Asia, and the middle east. Climatic changes resulting in reduced tourism activities will result in economies that depend on tourism to flourish to flop.

Ramanathan et al 2019 believe that bending of the curve to prevent the upward trajectory on pollution is the answer to the climatic changes that seem disastrous. Prevention of emissions

to avoid pollution will save the lives of the billions of people who depend on climate stability for their way of life. Pollution results in climatic changes that result in catastrophes. The other better solution to the protection of humanity by having the answers to the climatic changes is the use of the natural-based solutions that are viewed to be multi-beneficial (Kabisch et al.2017).

The discussion focuses on the periodic changes in climate that result in the problem in the environment hence forcing the humans to induce the policies that are meant to find the remedy to the problem resulting from the climatic changes. There have been many researchers who will want to find the problems that are resulted by the climatic changes while on the other hand, the other researcher ill tries to find the way out of the problems created by the climate changes. The researchers also look into the people's attitudes and views concerning the changes in the climate. The climate changes only the best result of economic depreciation and even have chances of the destruction of the human race.
