Responses

- 1.** I agree that in today's businesses, IT security is mandatory. E-commerce and technology have developed, making it easy for criminals to steal data. In doing this, encryption has to be ensured on all the computers using the internet. It protects data from unauthorized parties; controls viruses that would help criminals navigate the systems and ensure smooth operations. Organizations must therefore invest in security to avoid losses of money and data as described making me support the post.
- 2.** Protecting information technology today is challenging but must be ensured for smooth functioning which I concur with. Incidents of hacking, spyware, and workers stealing data are common but avoidable. As described, the most appropriate tools to apply are encryption, firewall, and virus protection software which is absolute truth. Also, I concede that employers should introduce rules on how employees use resources in the organizations and monitor them to ensure security. The actions lower the chances of attacks, and when they happen, fast recovery is guaranteed.
