Evolution of Diagnostic Reasoning Process

The diagnostic reasoning process is a process that deals with the reasoning behind the results found from a diagnosis. The diagnosis is done by getting a good history of a person and doing a great physical examination that helps in differentiating the diagnosis made. Specifically, some things have changed dramatically over the years when they had so much emphasis on diagnostic testing (Costa & Luz, 2015). Initially, diagnostic skills were all about the patient's history and trusting ourselves to offer the best solution. As a result, I ended realizing that the best diagnostic reasoning process starts by getting to know the patients' history. This helped me to evolve such that knowing the history of a patient will help in prescribing the right type of medication.

From the diagnostic reasoning process, I have gotten to understand that it is important for being a quality, cost-effective practice registered nurse. By offering affordable, quality and cost-effective services help in reducing the rate of deaths, infections and suffering experienced. Additionally, I got to understand that creating a great quality yet cost-effective environment with the right diagnostic helps a patient not spending extra cash in finding the diagnosed disease.

Notably, I grew up knowing the dangers that come with altering the diagnostic reasoning just to fit the area of expertise of the nurses. This might cause further effects on the patient and that might be severe and cause serious problems for them. From the above, I got to see the importance of getting to know the diagnosis reasoning that helps one in problem-solving and prevents infection from getting to the patient.
