Post 1

I agree that human beings have been involved in making finished products from raw materials since history. The exercise needs tools and weapons, which they made in converting wild animals into foods in early times. With time, humans saw the need to use animals and cooperate, which led to settlements' development. As it is illustrated, the exercise has evolved where today; technology has brought easy and efficient ways of converting raw materials into finished products. Besides, new ideas are being developed, increasing the probability of more transformations.

Post 2

I concur with the post that the historical paradigm is categorized into five stages. The humans first used the raw materials to meet their needs, for example, security where they used spears. They then used animals for transportation, agriculture, and in making wheeled vehicles. Notably, considering that humans are naturally social, the people found the need to work together, which led to settlements making. It is clear that they used natural resources in making houses as well as planting crops for food. Innovation among them improved, where machines were made. The practice is on, evident by technology, which is still evolving.
